

Reflection Paper

I learned from this project how to implement JavaScript and Media Query for the behavior and responsiveness of the project through different sizes of screens and mobile view. It trains me to become organized in terms of class naming and CSS. I've encountered a problem when styling the same element class and name but different section. I learned that even you use the same element you should separate or modify the class name so you can style the same element differently. The JavaScript makes me feel like I'm programming a certain thing that has variables and algorithms.

The project MyWebPortfolio makes me feel more confident in my skills while developing my own portfolio by learning essentials like being responsive and applying behavior on the website which is the JavaScript.
